**CONSISTENT
AI VIDEO**

Welcome to the PYROS Express Workflow

Before starting this workflow, make sure you have completed the [PYROS Express Workflow — Part 1: Images](#). Your **Character Reference Sheet** is the foundation for this workflow. If you haven't created yours yet, go back to Part 1 and build it first.

Your character is ready. Now bring them to life.

Moving from images to video introduces a new challenge: **keeping the same character consistent while they move, act, and appear across different shots.**

Faces can drift, hairstyles can change, proportions can shift, and the character can gradually lose the identity established in your reference.

The **PYROS Express Video Workflow** gives you a practical way to use your existing **Character Reference Sheet** as the identity anchor for AI-generated video.

You can use it to create individual shots, multi-character scenes, dialogue, action and transformation sequences, while maintaining character consistency throughout the scene.

The goal is simple:

The same character. Different shots. Consistent identity.

You already created the identity.

Now it's time to keep it consistent in motion.

Why PYROS Express?

The PYROS Express Video Workflow turns your existing Character Reference Sheet into a practical foundation for consistent AI video.

The principle is simple:

One Character Reference → Multiple Shots → Consistent Identity

The reference sheet anchors **who the character is**.

Your prompt defines **what happens next** — the action, environment, camera and movement.

This keeps the workflow simple while giving you greater control as your character moves from one shot to the next.

Build the identity once. Then use it throughout your video.

Purpose

Learn a practical workflow for using your existing **Character Reference Sheet** to create consistent AI video shots.

You'll learn how to take the same character into individual shots, storyboard-based sequences, multi-character scenes, dialogue, and action while maintaining visual and spatial continuity.

Deliverables

By the end of this guide, you'll have:

- **Express Video Consistency Workflow** — a repeatable method for taking your Character Reference Sheet and Environment Reference Sheet into AI video generation.

Including:

- **Character Look & Outfit Adaptation** — a method for adapting your character's appearance and outfit to fit your story while preserving identity.
- **Environment Reference Sheet** — a reusable environment reference for maintaining environment consistency across your shots.
- **Start Frame** — a method for creating a strong visual starting point for your video shot using your character and environment references.
- **Cinematic Scene Prompt Builder** — a reusable prompt for turning your scene description and references into a production-ready video prompt.

This workflow is designed for:

-  AI actors and cinematic characters
-  Short films and narrative productions
-  Commercials and branded content
-  Background characters and extras
-  Realistic and stylized characters

Choosing the Right Video Workflow

The **Express Video Workflow** can scale from simple character motion to complex cinematic sequences.

The workflow can be used with different types of characters, but results may vary depending on how much of the character's identity is defined by fine visual details.

Characters with **intricate costumes, extensive tattoos, distinctive accessories, armor, or other highly specific design elements** may benefit from the more advanced **PYROS Cinematic Reference Sheet Workflow**, which will be introduced in a future guide.

The **Express Workflow** is optimized for **identity**. The **Cinematic Workflow** adds greater control over **visual details**.

The Express Video Workflow can still be used with these characters, but **consistency of highly detailed design elements cannot be guaranteed across every video shot**.

Workflow 1 — Adapt Your Character's Look

Adapt Your Character for the Story

Before creating the first cinematic shot, adapt your character's look to the story.

The **identity remains unchanged**. We are only adapting the visual styling — outfit, hairstyle and makeup — to fit the role, genre and world of the production.

1. Open Flow

Open **Flow** and create a new project.

[Flow](#)

Attach your **Express Character Reference Sheet**.

- **Model:** Nano Banana 2 or Nano Banana Pro
- **Aspect Ratio:** 16:9

2. Use the Character Styling Prompt

Copy the prompt below and attach your Character Reference Sheet.

The prompt is designed to modify only the visual elements you specify while preserving the character's identity, anatomy and reference-sheet structure.

You only need to describe:

- **CLOTHING / OUTFIT**
- **HAIRSTYLE**
- **MAKEUP**

If one of these does not need to change, simply remove that section.

Character Styling Prompt

Using the attached character sheet as the **master character reference**, edit the character while preserving the character's identity and the entire existing character-sheet structure.

ONLY modify these three variable areas:

1. **CLOTHING / OUTFIT:** [DESCRIBE THE NEW OUTFIT IN DETAIL — garments, colors, materials, fit, shoes, accessories]

2. **HAIRSTYLE:** [DESCRIBE THE NEW HAIRSTYLE — cut, length, parting, styling, texture, color if intentionally changing it]

3. **MAKEUP:** [DESCRIBE THE NEW MAKEUP — complexion, eyes, brows, eyeliner, mascara, lips, blush, intensity]

Treat the attached character sheet as the authoritative visual reference for the character. Apply the requested changes consistently across **all views shown in the sheet**, including the front view, both profile views, back view, and facial close-ups.

Preserve the character exactly

Maintain the same recognizable character identity and anatomy:

- identical facial identity and facial structure
- same eyes, eye shape, eye color, nose, lips, jawline, cheekbones and overall proportions
- same skin tone, skin texture and natural facial characteristics
- same body shape, height, proportions and physique
- same apparent age
- same hands, arms, legs and anatomical proportions
- same neutral facial expression and character likeness
- same pose, camera viewpoints and framing for every panel
- same character-sheet layout and number of views
- same white studio background
- same neutral studio lighting, shadows and photographic rendering
- same overall image quality, realism and visual style

Editing boundary

Use **semantic masking / localized editing**: conceptually restrict the edit to the clothing, hair and makeup regions.

The clothing change must follow the character's existing body proportions and perspective naturally across every view. The hairstyle must remain physically coherent from the front, both profiles and the back. The makeup must remain consistent with the facial geometry visible in every facial reference.

Do **not** reinterpret, redesign, regenerate or beautify the character. Do not change the character's identity or anatomy. Do not change the composition or camera viewpoints.

The final image must look like the **same exact character sheet photographed/rendered in the same session**, with only the requested clothing, hairstyle and makeup replaced.

3. Generate the Updated Reference Sheet

Generate the edited Character Reference Sheet.

Check that the new styling has been applied consistently across all views while the character's face, anatomy and recognizable identity remain unchanged.

Result: You now have a production-ready version of your character, adapted specifically for the story while preserving the original identity.

For this story, I'll use the following look.

I kept the makeup very natural because **heavy makeup can significantly alter the perceived appearance of a character's face**. Since we will use this character throughout the video workflow, this gives us a cleaner test of facial consistency.

Character Styling — Example

- **CLOTHING / OUTFIT:** *A sophisticated yet practical researcher outfit: a fitted white laboratory coat worn over a simple dark charcoal blouse, tailored black trousers and understated black leather ankle boots. A slim black belt and a simple wristwatch. Minimal accessories, no visible branding.*
- **HAIRSTYLE:** *Hair styled naturally loose with a clean, professional appearance. Keep the character's existing hair color, length, texture and natural characteristics completely unchanged. The hairstyle should be practical and slightly controlled, with the hair kept away from the face without looking overly styled.*
- **MAKEUP:** *Natural, understated makeup with a clean complexion, subtly defined eyebrows, minimal eye makeup, natural mascara, soft neutral lips and very subtle blush. No dramatic makeup or beauty-filter effect.*

Workflow 2 — Environment Reference Sheet

Generate Your Environment Reference Sheet

To keep your environment consistent across different shots, we'll first create the environment and then turn it into a reusable **Environment Reference Sheet**.

1. Create Your Environment Prompt

Open **Claude** and use the **Environment Prompt Builder** to create a detailed image-generation prompt based on the location in your story.

2. Generate Your Environment Reference

Copy the generated prompt into **Flow**, set the aspect ratio to **16:9**, and generate the image.

Download the result in **2K**.

Environment Prompt Builder

I want to create a cinematic environment for an AI-generated film.

STORY / SCENE: [DESCRIBE THE SCENE AND THE LOCATION YOU NEED]

Based on the scene above, create a detailed image-generation prompt for the environment only.

The prompt must define the environment in enough detail to create a strong, realistic and reusable environmental reference.

Include the following sections:

ENVIRONMENT Define the type of place, its purpose, architecture and overall spatial character.

ARCHITECTURE & MATERIALS Describe walls, floors, ceilings, doors, windows, structural elements, surfaces, materials, colors and finishes.

FIXED ENVIRONMENTAL ELEMENTS Identify the important objects and architectural elements that should remain fixed and recognizable in future views. Include furniture, equipment, counters, desks, vehicles, machinery, props or other elements that are essential to the environment.

SPATIAL LAYOUT Clearly describe where the important elements are positioned relative to one another. Establish entrances, exits, major objects, walls, windows and other spatial anchors.

LIGHTING Define the light sources, direction, intensity, color temperature, time of day, shadow quality and overall lighting atmosphere.

ATMOSPHERE & VISUAL STYLE Define the visual tone and cinematic style of the environment. Keep it photorealistic and appropriate for a live-action film.

CAMERA & COMPOSITION Create a realistic **three-quarter view of the room/location**, showing enough of the space to clearly understand its layout and major fixed elements. Use a natural cinematic perspective with realistic proportions and no extreme wide-angle distortion.

NEGATIVE REQUIREMENTS

No people, characters, human figures or crowds.

The final prompt must describe **only the environment**, with no characters performing actions.

Return only the final image-generation prompt, without explanations.

3. Create the Environment Reference Sheet Prompt

Upload your generated environment image to Claude together with the **Environment Reference Prompt** provided below.

Claude will analyze the environment and create a customized prompt designed to generate multiple views of the same environment while preserving its architecture, layout and visual identity.

Environment Reference Sheet Builder — Indoor

Professional environment reference sheet for the exact same physical environment.

[TYPE OF SPACE], designed as a coherent, realistic and physically consistent interior. Preserve a clear and believable spatial layout with consistent architecture and proportions.

ARCHITECTURE AND MATERIALS:

[WALL MATERIAL, COLOR AND FINISH], [FLOOR MATERIAL, COLOR AND FINISH], [CEILING DESCRIPTION], [DOORS AND WINDOWS DESCRIPTION], [ARCHITECTURAL FEATURES].

FIXED SPATIAL ELEMENTS:

[MAIN COUNTER / WORK SURFACE], [MAIN STATION], [SECONDARY STATION], [EQUIPMENT ITEM 1], [EQUIPMENT ITEM 2], [EQUIPMENT ITEM 3], [STORAGE / SHELVING], [OTHER IMPORTANT FIXED ELEMENTS].

SPATIAL LAYOUT:

[DESCRIBE WHERE THE MAJOR ELEMENTS ARE LOCATED RELATIVE TO EACH OTHER: entrance, windows, counter, stations, equipment, walls, etc.].

These elements are fixed architectural and environmental anchors and must remain in exactly the same relative positions throughout all four views.

LIGHTING:

[LIGHT SOURCE AND DIRECTION], [COLOR TEMPERATURE], [LIGHTING QUALITY], [SHADOW CHARACTERISTICS].

Use identical lighting conditions, illumination direction, color temperature, exposure and shadow behavior across all four views.

CAMERA AND REFERENCE SHEET:

Generate exactly 4 views of the SAME room arranged in a clean 2x2 grid.

TOP-LEFT — ESTABLISHING VIEW:

Wide front establishing shot showing the overall room layout, major architectural features and spatial relationships between the fixed elements.

TOP-RIGHT — 45-DEGREE VIEW:

45-degree angle overview from the opposite camera position, clearly showing depth, room geometry and the same fixed elements from a different perspective.

BOTTOM-LEFT — MAIN STATION:

Detailed medium-wide view of [MAIN STATION], while retaining enough surrounding architecture and environmental context to clearly establish its exact position within the room.

BOTTOM-RIGHT — SECONDARY STATION:

Detailed medium-wide view of [SECONDARY STATION], again retaining sufficient surrounding architecture and spatial anchors to establish its exact position within the same room.

CRITICAL CONSISTENCY RULES:

All four views must depict the exact same physical room.

Do not redesign, rearrange, reinterpret or modify the environment between views. Maintain identical architecture, room dimensions, wall positions, floor, ceiling, doors, windows, counters, furniture, equipment, object placement, proportions, materials and colors across all four views.

Only the camera position, viewing angle and framing may change.

Maintain consistent object scale and perspective.

Fixed elements must remain consistent whenever visible. Do not introduce, remove or redesign elements between

views.

The four views must be spatially coherent and logically connected as different camera positions inside one real environment.

VISUAL STYLE:

Photorealistic professional architectural and commercial photography, physically accurate materials, realistic proportions, natural perspective, subtle depth of field, high material detail, clean professional presentation.

OUTPUT:

Exactly four views in a 2x2 grid.

No people.

No captions.

No decorative borders.

No changes to architecture or layout between views.

Clean neutral background around the grid.

The final image must function as a professional environment reference sheet for maintaining visual and spatial consistency in future image and video generation.

Environment Reference Sheet Builder — Outdoor

Professional environment reference sheet for the exact same physical environment.

[TYPE OF EXTERIOR ENVIRONMENT], designed as a coherent, realistic and physically consistent outdoor environment. Preserve a clear and believable spatial layout with consistent architecture, terrain and proportions.

ENVIRONMENT AND MATERIALS:

[GROUND / TERRAIN MATERIAL, COLOR AND CONDITION], [VEGETATION DESCRIPTION], [ARCHITECTURAL STRUCTURES OR NATURAL FORMATIONS], [SKY / ATMOSPHERIC CONDITIONS], [OTHER IMPORTANT ENVIRONMENTAL FEATURES].

FIXED ENVIRONMENTAL ELEMENTS:

[MAIN LANDMARK], [SECONDARY LANDMARK], [DISTINCTIVE NATURAL OR ARCHITECTURAL FEATURE 1], [FEATURE 2], [FEATURE 3], [PATH / ROAD / WATER FEATURE], [OTHER IMPORTANT FIXED ELEMENTS].

SPATIAL LAYOUT:

[DESCRIBE WHERE THE MAJOR ENVIRONMENTAL ELEMENTS ARE LOCATED RELATIVE TO EACH OTHER: buildings, roads, paths, trees, rock formations, mountains, water, landmarks, etc.].

These elements are fixed environmental anchors and must remain in exactly the same relative positions throughout all four views.

LIGHTING:

[LIGHT SOURCE AND DIRECTION], [COLOR TEMPERATURE], [LIGHTING QUALITY], [SHADOW CHARACTERISTICS].

Use identical lighting conditions, illumination direction, color temperature, exposure and shadow behavior across all four views.

CAMERA AND REFERENCE SHEET:

Generate exactly 4 views of the SAME exterior environment arranged in a clean 2x2 grid.

TOP-LEFT — ESTABLISHING VIEW:

Wide establishing shot showing the overall environment, major landmarks and spatial relationships between the fixed environmental elements.

TOP-RIGHT — 45-DEGREE VIEW:

45-degree angle overview from an alternate camera position, clearly showing depth, terrain or architectural geometry and the same fixed elements from a different perspective.

BOTTOM-LEFT — PRIMARY LANDMARK:

Detailed medium-wide view of [MAIN LANDMARK], while retaining enough surrounding environment and spatial context to clearly establish its exact position within the environment.

BOTTOM-RIGHT — SECONDARY AREA:

Detailed medium-wide view of [SECONDARY LANDMARK / AREA], again retaining sufficient environmental context and spatial anchors to establish its exact position within the same environment.

CRITICAL CONSISTENCY RULES:

All four views must depict the exact same physical exterior environment.

Do not redesign, rearrange, reinterpret or modify the environment between views.

Maintain identical terrain, architecture, landmarks, vegetation, roads, paths, water features, geological formations, proportions, materials and colors across all four views.

Only the camera position, viewing angle and framing may change.

Maintain consistent environmental scale and perspective.

Fixed elements must remain consistent whenever visible. Do not introduce, remove or redesign elements between views.

The four views must be spatially coherent and logically connected as different camera positions within one real environment.

VISUAL STYLE:

Photorealistic professional cinematic environment photography, physically accurate materials, realistic proportions, natural perspective, realistic atmospheric depth, high environmental detail, clean professional presentation.

OUTPUT:

Exactly four views in a 2x2 grid.

No people.

No captions.

No decorative borders.

No changes to the environment, terrain or spatial layout between views.

Clean neutral background around the grid.

The final image must function as a professional environment reference sheet for maintaining visual and spatial consistency in future image and video generation.

3. Generate your Environment Reference Sheet

Copy the customized prompt generated by Claude.

Paste it into **Flow** and attach the original **environment image**.

Generate the image.

The result is a **2×2 Environment Reference Sheet, showing different views of the same environment.**

This sheet becomes the visual reference for your environment throughout the production.

Workflow 3 — Create Your Start Frame

1. Create the Prompt

Open **Claude** and use the **Start Frame Prompt Builder** to create a detailed image-generation prompt based on your scene.

2. Generate the Image

Copy the generated prompt into **Flow** and attach the relevant **Character Reference Sheet(s)** and **Environment Reference Sheet**. Generate the image using the desired aspect ratio.

3. Use It as Your Start Frame

Download the generated image and use it as the **First Frame** when generating your video shot. The First Frame establishes the character, environment, composition and initial action of the sequence.

Start Frame Prompt Builder

I want you to turn my scene description and the attached visual references into a complete image-generation prompt for the START FRAME of an AI video shot.

SCENE:

[PASTE YOUR SCENE HERE]

ATTACHED REFERENCES:

Use all attached visual assets as references according to their type and upload order.

Analyze the scene and references and determine everything required to create the most appropriate opening frame, including:

- character identity, appearance and position
- character pose, body orientation and expression
- environment and spatial relationships
- relevant props
- camera position and framing
- composition
- lighting
- atmosphere
- visual style
- the exact initial state of the action

The Start Frame must represent the precise visual moment at which the video begins.

Do not depict actions that should happen later in the scene. Establish only the initial state of the characters, environment and objects at the beginning of the shot.

If the scene contains multiple characters, determine their positions and interactions based on the scene description.

If a character's face is not supposed to be visible in the opening moment, preserve that composition rather than revealing the face unnecessarily.

If a specific prop is present at the beginning of the scene, include it in the correct position and maintain its visual relationship with the character and environment.

REFERENCE MAPPING

Clearly identify every attached asset by upload order and define its role.

Example:

Image 1 — Character Reference: protagonist

Image 2 — Character Reference: colleague

Image 3 — Environment Reference: laboratory

Image 4 — Prop Reference: notebook

Create the final image-generation prompt using this structure:

CHARACTER

Describe the character's appearance, identity, pose, body orientation, expression and position in the frame.

Use the Character Reference as the master identity reference. Preserve the character's facial features, hairstyle, body proportions, clothing and distinctive characteristics.

ENVIRONMENT

Describe the environment and spatial composition required for the opening frame.

Use the Environment Reference as the master environmental reference. Preserve its architecture, layout, materials, lighting and distinctive elements.

PROPS

Include only props that are relevant and present at the beginning of the scene and only if attached.

Preserve their appearance, scale and relationship to the character and environment.

COMPOSITION

Define the exact placement of the characters and important objects within the frame.

CAMERA

Define the appropriate shot size, camera position, angle, perspective and lens characteristics for the opening composition.

POSE & ACTION

Describe the exact physical state of each character at the beginning of the video.

The characters must appear ready for the action that follows, but must not perform actions that occur later in the scene.

LIGHTING & ATMOSPHERE

Define the appropriate lighting, color temperature, shadows and atmosphere based on the scene and references.

VISUAL STYLE

Create a photorealistic cinematic frame with realistic anatomy, materials, proportions, lighting and professional cinematography.

CONSISTENCY

Preserve the identity of all referenced characters and the visual characteristics of the referenced environment and props.

Do not redesign referenced elements.

NEGATIVE REQUIREMENTS

Include only relevant restrictions necessary to prevent unwanted results in this specific scene.

No people other than characters explicitly required by the scene.

No captions.

OUTPUT

Return ONLY the final image-generation prompt.

Do not explain your choices.

Do not add commentary before or after the prompt.

Do not provide multiple versions.

Workflow 4 — Generate Your Cinematic Video

1. Prepare Your Scene

Go to **Claude** and attach the **Cinematic Scene Prompt Builder** below and paste your scene description into the highlighted area.

2. Add Your References

Attach all the assets required for the scene:

- **Character Reference Sheet(s)** — one for every character appearing in the scene.
- **Environment Reference Sheet** — for the environment.
- **Storyboard** or **Start Frame / End Frame** — if you are using them.
- **Audio Sample** — if the scene includes dialogue. Use a short sample of the voice you want to maintain for voice consistency (8-10 secs are enough).
- **Prop Reference(s)** — for any important props used in the scene.

3. Generate the Prompt

Click generate.

Claude will analyze your scene and all the attached references and create a **production-ready video prompt** specifically structured for Seedance 2.5.

The prompt can also be adapted for other AI video generators.

Cinematic Scene Prompt Builder

I want you to turn my scene description and the attached visual/audio references into a complete video-generation prompt.

SCENE:

[DESCRIBE WHAT HAPPENS IN THE VIDEO]

ATTACHED REFERENCES:

Use all attached assets as visual or audio references according to their type and upload order.

Analyze the scene and references and determine everything required to generate the video, including character actions, interactions, expressions, camera, composition, movement, timing, environment, lighting and sound.

If dialogue is present in the scene, include the dialogue exactly as provided and create the corresponding character

performance and lip synchronization. If an audio reference is attached, explicitly bind it to the correct character and use it as the voice and timing reference.

If a Start frame is attached, explicitly identify the corresponding asset using its @Image tag and designate it as the start frame.

If an end frame is attached, explicitly identify the corresponding asset using its @Image tag and designate it as the end frame.

If a storyboard is attached, use it to determine the intended shot progression, composition and action.

Create the final video-generation prompt using this structure:

ASSET REFERENCES

Clearly map every attached asset by upload order and refer to each asset using the exact reference tag format used by the video generator, such as @Image1, @Image2, @Audio1, etc.

Example:

@Image1 — Character Reference: subject1

@Image2 — Character Reference: subject2

@Image3 — Environment Reference: environment1

@Image4 — Prop Reference: prop1

@Image5 — Start Frame

@Audio1 — Dialogue reference for the protagonist

ONE-SENTENCE SUMMARY

Write one concise sentence describing the subject, environment, event, cinematic style and camera movement.

DETAILED PLOT

Describe the complete visual progression of the video.

Use timestamps or shot numbers whenever the scene contains multiple actions or camera changes.

For every section, define the relevant action, character performance, camera movement, dialogue and sound.

REFERENCE CONSISTENCY

Clearly state how the character, environment and prop references must be preserved throughout the video.

CAMERA

Define the appropriate shot sizes, angles, lens perspective and camera movements for the scene.

LIGHTING & STYLE

Define the appropriate cinematic lighting, atmosphere and visual style.

AUDIO

Include dialogue, voice performance and synchronized sound effects whenever they are relevant to the scene or provided through an audio reference.

If the scene contains no dialogue, do not invent dialogue.

If no music is requested, do not add background music.

NEGATIVE REQUIREMENTS

Include only necessary restrictions that prevent unwanted results in this specific scene.

OUTPUT

Return **ONLY** the final video-generation prompt.

Always reference uploaded assets using their exact @Image1, @Image2, @Image3, @Audio1, etc. tags throughout the generated prompt. Never write “Image 1”, “Image 2”, “Audio 1”, or similar generic references.

Do not explain your choices.

Do not add commentary before or after the prompt.

Do not provide multiple versions.

Step 4 — Move to Your Video Generator

Copy the prompt generated by Claude and open your AI video generator.

Upload the **same reference assets** you used in Claude, keeping the same upload order.

Step 5 — Check Your References

Before generating, verify that every uploaded asset is assigned to the correct reference tag.

Make sure:

- Each **character reference** is assigned to the correct character.
- The **Environment Reference** is correctly identified.
- The **Start Frame** and **End Frame**, when used, are correctly assigned.
- Any **Prop Reference** is mapped to the correct object.
- Each **Audio Reference** is assigned to the correct character.

Finally, check that the tags used in the generated prompt — @Image1, @Image2, @Audio1, etc. — correspond to the correct assets in your video generator.

This is important because **incorrect reference mapping can lead to character, object or voice confusion.**

How the References Work

Each reference has a specific **role** in maintaining consistency throughout the shot.

Character Reference

character identity

Environment Reference

environment and spatial continuity

Prop Reference

important objects

Start / End Frame

visual starting and ending points

Storyboard

composition and shot progression

Audio Reference

voice consistency and dialogue timing

DIALOGUE EXAMPLE:
"We don't have much time."

DURATION: 2.4 sec

Step 6 – Set Your Generation Parameters

Select the **video generation model** you want to use, for example **Seedance 2.5**.

Then configure the generation settings based on the prompt:

- **Duration:** set the video duration according to the timeline defined in the prompt. If needed, adjust the timing to make the sequence faster or slower. When dialogue or an audio reference is used, keep the duration aligned with the audio.
- **Aspect Ratio:** choose the format required for your project, such as **16:9** or **9:16**.
- **Video Quality:** select the desired output quality, such as **480p**, **720p** or **1080p**, depending on the available options and your needs.

Step 7 — Generate

Once everything is set, run the generation and review the result.

The character references maintain **who** is in the scene, the Environment Reference maintains **where** it takes place, and the video prompt defines **what happens and how it is filmed**.

If the result fails, don't immediately rebuild the workflow. Regenerate first. AI video models are probabilistic. A single failed generation does not necessarily mean the references or prompt are wrong.

Consistency Stress Tests

Now that our character, environment and references are ready, it's time to put the workflow to the test.

These four scenes are designed to challenge consistency in different ways — from maintaining a single face across camera movement to keeping multiple characters recognizable, revealing a face that isn't visible in the starting frame, and preserving identity through a dramatic transformation.

The goal is simple: **see how consistently our references survive as the scene becomes more complex.**

TEST 1 — One Character

What we test:

Consistency of a single character's face and identity while the camera changes position, framing and distance.

Also testing: Environment consistency as the camera reveals different parts of the same environment.

References:

Start Frame + 1 Character Reference Sheet + 1 Environment Reference Sheet

TEST 2 — Two Characters

What we test:

Consistency of **two different character faces and identities** during interaction, dialogue, expressions and camera changes.

Also testing: Environment consistency throughout the interaction.

References:

Start Frame + 2 Character Reference Sheets + 1 Environment Reference Sheet + 2 Voice Samples

TEST 3 — The Turn

What we test:

Consistency when the protagonist's face is **not visible in the Start Frame**, while the second character is also introduced later in the shot.

The researcher walks away from the camera. Her colleague, who is **not visible in the Start Frame**, calls her. She turns around, revealing her face, while the colleague enters the scene and presents the forgotten object.

Prop:

The **worn laboratory notebook** is also introduced during the shot, allowing us to test whether a new prop can remain visually consistent after appearing.

References:

Start Frame + 2 Character Reference Sheets + 1 Environment Reference Sheet + 1 Prop Reference + 2 Voice Samples

TEST 4 — The Transformation

What we test:

Consistency of **both characters' faces and identities** during a dramatic physical transformation, while maintaining the consistency of the surrounding environment throughout the sequence.

References:

Start Frame + 3 Character Reference Sheets + 1 Environment Reference Sheet + 1 Voice Sample

Watch the video to see the results of all four consistency tests in action: [Watch the Results](#)

Conclusion

You've completed the **PYROS Express Video Workflow**.

You started with your **Express Character Reference Sheet** and learned how to use it together with **environment references** to create cinematic video shots while keeping your character's identity consistent.

You can now use your references to create:

- **Single-character shots with consistent facial identity**
- **Scenes involving multiple characters**
- **Different camera angles and character movements**
- **Character interactions and dialogue**
- **Complex action and transformation sequences**

The key is simple:

Strong References → Consistent Characters in Motion

Results will naturally vary depending on the AI video model, references, prompt, and generation settings. No workflow can guarantee perfect consistency in every shot. AI video models are still imperfect, and sometimes the best solution is simply to **regenerate the shot**. However, starting with a strong character reference gives the model a much more reliable visual identity to follow and increases the chances of achieving a consistent result.

What's Next?

The **Express Video Workflow** is one part of the broader **PYROS Character Consistency Pipeline**.

You've now learned how to take the character you created in Part 1 and bring that identity into AI-generated video.

Available Now

✓ [Express Workflow — Part 1: Images](#)

Create a professional **Express Character Reference Sheet** from a single image and use it to create consistent AI images across different scenes, poses and environments.

✓ [Express Workflow — Part 2: Video](#)

Use your **Express Character Reference Sheet** together with environment references to generate cinematic AI video while testing character consistency across camera movement, multiple characters, dialogue, hidden faces and transformations.

Coming Soon

Cinematic Workflow

Build enhanced Character Reference Sheets for characters that require greater visual detail and control, including intricate costumes, tattoos, distinctive features and other elements where consistency is especially important.

Thank you for supporting PYROS AI Creative.
