MUSIC

FILM

pyrosaicreative.com

Introduction

Google Flow Music is a powerful AI filmmaking tool that lets you turn an existing script into cinematic images, video scenes, dialogue, and music.

In this guide, I'll show you the workflow I used to create an AI short film, including the prompts and techniques used throughout the process.

You can follow the workflow step by step and adapt it to your own stories and filmmaking projects.

What You'll Learn

By the end of this guide, you will be able to:

- Create cinematic photos that establish your scenes
- Turn those photos into cinematic video clips
- Build scenes with natural-looking dialogue
- Achieve consistent character voices
- Generate a cinematic soundtrack that matches your scenes
- Recreate the workflow using the included prompts

How Much Creative Control Do You Have?

Google Flow Music takes a different approach from traditional AI generation tools.

Instead of choosing between separate Image, Video, or Music modes, you simply describe what you want the AI agent to create.

This means you can decide how much control you want to have. You can give the agent a simple creative direction and let it handle the details, or provide more specific instructions when you need greater control over the result.

Since there are no traditional settings for things like model, aspect ratio, quality, or audio, these instructions need to be included directly in your prompt. But don't worry — I'll show you exactly how to specify them in the prompts throughout this guide.

The more specific your instructions are, the more control you have over the generation.

And you don't need to write a perfect generation prompt yourself. The agent takes your instructions and turns them into the prompt used for generation.

The AI Filmmaking Workflow with Google Flow Music

Step 1 — Sign Up for Google Flow Music

To get started, sign up for Google Flow Music using my referral link below.

<https://www.flowmusic.app/invite/MWXUUD>

Once you've completed the sign-up, open Google Flow Music and you're ready to start the workflow.

Step 2 — Create Your First Project

1. Open Google Flow Music and go to the **Home** page.
2. From the menu on the left, click **Projects**.
3. Click **Create a new project** and give your project a name.
4. Open your new project by clicking on it.

You're now ready to start your first session.

Important: Unlike traditional AI tools, Flow Music doesn't give you separate buttons for **Image**, **Video**, or **Music**. Instead, you **simply tell the AI agent what you want it to create** using your prompt.

The more specific your instructions are, the more control you have over the result.

You also don't need to worry about writing every prompt from scratch. **All the prompts used in this workflow are included in this guide.**

Step 3 — Create Your Environment

The first step is to create the environment for your film.

Describe the environment you want the AI agent to create, and include the generation settings directly in your prompt:

- **Model**
- **Aspect ratio**
- **Quality**

You don't need to write a perfect generation prompt. Simply explain what you want, and Flow Music will turn your instructions into a proper generation prompt.

Here is the prompt I used:

Create the Cinematic Environment

Create a cinematic realistic photo of *a vast and flat expanse stretching toward a horizon of leaden skies, featuring a ground surface composed entirely of fine black volcanic sand and deep drifts of soot. The atmosphere is thick with falling gray ash that occasionally freezes into jagged, needle-like ice crystals due to unnatural temperature shifts. The environment is devoid of vegetation or landmarks, creating a desolate and monochromatic landscape of dark, gritty textures.*

Model: Nano Banana 2

Ratio: 16:9

Quality: 2K

And here's the result.

Step 4 — Create Your Character Scene

To keep your character consistent, you'll need a **character reference sheet**.

Don't have a character reference sheet yet?

Watch this tutorial to learn how you can turn a single character photo into a complete reference sheet with just one prompt.

Once you have your reference sheet:

1. Attach your **character reference sheet** to the session.
2. Add your **prompt**.

You can use the environment from the previous generation in two ways: either tell Flow Music in your prompt to use the image it just created as a reference, or download the image and attach it to the session. In the latter case, make sure your prompt clearly explains how you want the attached image to be used for the new scene.

Character in the Environment

Use the attached image of *Pyros* as the strict character reference. Create a cinematic image of *Pyros* walking alone through the vast volcanic ash desert you have just created. Preserve *Pyros*'s exact facial features, identity, hairstyle, body proportions, and outfit from the reference image.

Model: Nano Banana 2

Ratio: 16:9

Quality: 2K

And here's the result.

Key Workflow Principle

References create continuity.

Use your **character reference** to preserve the character's identity and your **environment reference** to maintain the visual setting across generations.

Character Reference + Environment Reference = Consistent Scene

Step 5 — Create Your First Video Scene

Now it's time to turn the character image we created in the previous step into our first video scene.

By default, Flow Music uses **Veo 3.1 Fast** for video generation. For this workflow, Omni 1.1 Flash is more useful because it gives us a more flexible and polished video-generation workflow with greater control over our reference images.

There are a few important details to get this right.

1. Use the word **“Generate”** in your prompt.
2. Tell Flow Music to use your image as an **ingredient**, not as a **start frame**.
3. Include **“audio enabled”** in every video prompt.

Simply mentioning the model name in your prompt is not enough to switch from the default model, so make sure you follow the instructions in the prompt carefully.

Animate the Character in the Environment

Generate a cinematic video using the image you just created as ingredient, and use the attached image of Pyros as the strict character reference. Preserve Pyros's exact facial features, identity, hairstyle, body proportions, and outfit from the reference image.

Pyros slowly walks forward through the vast volcanic ash desert, looking around cautiously as he takes in the completely desolate landscape. His movements are natural and realistic. Wind gently blows fine volcanic ash across the ground and around his body. The environment remains completely empty and barren, with no vegetation, buildings, or other characters.

Cinematic camera movement, realistic walking motion, subtle atmospheric haze, dramatic natural lighting, photorealistic.

Model: Omni 1.1 Flash

Audio: Enabled

Ratio: 16:9

Duration: 10 seconds

Resolution: 720p

Omni 1.1 Flash

Duration
Up to 10 seconds
(selectable: 4, 6, 8, 10 seconds)

Maximum resolution
1080p

BEST USED FOR

Character consistency and complex scenes

Supports multiple reference images (ingredients) to maintain subject identity.

Integrated audio and dialogues

Generates synchronized audio (voices, sound effects, environments).

Longer duration

Up to 10 seconds per clip.

Veo 3.1

Duration
Up to 8 seconds
(selectable: 4, 6, 8 seconds)

Maximum resolution
1080p

BEST USED FOR

Maximum visual quality

Perfect for the highest cinematic quality, with fluid camera movements, complex lighting and photorealistic details.

Transitions

Great when you want to define both a start frame and an end frame.

Veo 3.1 Fast

Duration
Up to 8 seconds
(selectable: 4, 6, 8 seconds)

Maximum resolution
1080p

BEST USED FOR

Fast iteration

The ideal choice to quickly test ideas, angles or concepts while maintaining excellent visual quality without long waiting times.

For complete music videos synchronized with the music, the dedicated pipeline can generate videos up to **120 seconds / 2 minutes** at **1080p**.

Step 6 — Extend the Scene

Now let's continue the story by extending the video we created in the previous step.

1. Attach your **character reference sheet** again.
2. Attach the **new reference image** you want to introduce into the scene.
3. Add your prompt.

As you can see, this time I asked Flow Music to **extend the previous video** and use the new image I attached as an **ingredient**.

I also clearly described how I wanted each attached image to be used, described the action, and kept the **same generation settings** as in the previous scene.

Introduce the Spider

Extend the previous video you have just created. Use the attached photo of the spider **as ingredient** and use the attached image of Pyros as the strict character reference. Preserve Pyros's exact facial features, identity, hairstyle, body proportions, and outfit from the reference image.

An enormous black spider suddenly bursts out from beneath the volcanic ash directly in front of Pyros, violently throwing ash and debris into the air. The giant spider rises to its full height, revealing its massive body and long, menacing legs, then lets out a terrifying, aggressive screech. Pyros immediately stops and faces the creature, shocked but ready to defend himself.

Cinematic action, realistic creature movement, dramatic camera shake, swirling volcanic ash, intense atmosphere, photorealistic.

Model: Omni 1.1 Flash

Audio: Enabled

Ratio: 16:9

Duration: 10 seconds

Resolution: 720p

Keep in mind that the generation may not always match your idea perfectly. In this case, I actually liked the way the spider gradually became larger as it entered the scene, so I kept the result.

Using the same approach, you can continue building the next scenes.

This is the other prompt I used for the spider scene. I didn't like the result, so I generated it a second time.

Pyros vs. the Giant Spider

Extend the previous video you have just created.

Use the attached photo of the spider as **ingredient** and **use the attached image** of Pyros as the strict character reference. Preserve Pyros's exact facial features, identity, hairstyle, body proportions, and outfit from the reference image.

The enormous black spider suddenly launches a thick, powerful web directly toward Pyros. Pyros reacts immediately, raising both hands and generating a massive ball of fire between his palms. He thrusts the fireball forward, sending it directly into the incoming web. The web catches fire and burns away as the huge fireball continues toward the spider, filling the scene with flames, sparks, and swirling volcanic ash.

Dynamic cinematic action, realistic creature movement, powerful fire effects, dramatic camera movement, intense lighting, photorealistic.

Model: Omni 1.1 Flash

Audio: Enabled

Ratio: 16:9

Duration: 10 seconds

Resolution: 720p

Regenerate When Needed

If a generation doesn't give you the result you want, simply ask the agent to **regenerate** the scene.

You don't need every generation to be perfect. Some elements can always be refined later during editing.

Step 7 — Create a Dialogue Scene

Now let's create another scene, this time with dialogue.

1. Go back to **Projects** and open a **new session**.
2. First, generate a new image of your **environment**.

For this scene, I created a village at the edge of the Ash Desert.

Village Environment

Create a cinematic realistic photo of *a small isolated settlement built at the edge of a vast volcanic ash desert, featuring several simple low stone houses constructed from dark volcanic rock, rough timber, and weathered clay. The buildings have low uneven roofs covered with coarse fabric, wood, and layers of accumulated ash. Narrow dirt paths covered in fine black volcanic sand run between the houses, with simple wooden fences, small storage structures, scattered firewood, clay pots, and a few dimly glowing braziers. Everything is weathered, dusty, and partially covered in gray ash. In the distance, the barren volcanic landscape stretches toward dark mountains beneath heavy leaden skies, with fine ash drifting through the air.*

The settlement feels isolated, harsh, primitive, and lived-in, with no modern technology or objects, creating a grounded cinematic atmosphere of survival in a hostile volcanic world. No people

Model: Nano Banana 2

Ratio: 16:9

Quality: 2K

And here's the result.

Then I generated the video by asking Flow Music to use the village image as an **ingredient** and clearly describing how to use the attached character reference sheets.

I then described the **scene, setting, action, and dialogue** I wanted to generate.

Dialogue Scene

Generate a cinematic video using the photo of the village you have just created **as ingredient**.

Use the attached images of Elena and Pyros as character references. Preserve their exact facial features, identity, hairstyle, body proportions, and outfit from the reference image.

Elena runs desperately toward Pyros, and she rapidly says, grabbing his arm: “My son is missing. He went into the Ash Desert this morning... and he never came back.”

Pyros replies: “I’ll find him.”

Model: Omni 1.1 Flash

Audio: Enabled

Ratio: 16:9

Duration: 10 seconds

Resolution: 720p

The scene looks great, but there’s one more thing we need to fix: **voice consistency**.

Step 8 — Achieve Voice Consistency

We'll replace the generated character voices while keeping the original sound effects from the scene.

Separate the Voices in CapCut

1. Open a new project in **CapCut**.
2. Import the video and add it to the timeline.
3. Right-click the clip and select **Separate Audio → Vocals**.
4. Turn the original audio volume all the way down.
5. Keep the first voice and remove the second voice.
6. Export the first voice as **audio only**.
7. Restore the second voice, remove the first one, and export it the same way.

Replace the Voices in ElevenLabs

1. Open **ElevenLabs** using my affiliate link below and select **Voice Changer** from the menu.

Try ElevenLabs →

<https://try.elevenlabs.io/4qvgy6bxom9j>

2. Upload the first audio file.
3. Select the voice you want to use and generate the new version.
4. Download the result.
5. Repeat the process for the second voice.

Put Everything Back Together

1. Import both new voice files into **CapCut**.
2. Place them on the timeline in their original positions.
3. Remove the extracted vocals.
4. Bring the original video audio back up to its original volume to keep the original **sound effects** from the scene.
5. Select everything, right-click, and choose **Create Compound Clip**.

And now we have the scene with consistent character voices while keeping the original sound effects.

Step 9 — Create the Soundtrack

Now we have our scene with consistent voices, so it's time to create the soundtrack.

Go back to your first session in **Google Flow Music** and use a prompt that describes the type of music you want and how it should fit the scenes you created.

Cinematic Soundtrack

Generate a cinematic science-fiction soundtrack that perfectly matches the scenes we have generated.

Flow Music will generate **two soundtrack options** for you to choose from.

Listen to both versions and select the one that works best for your film.

Once you've made your choice, download the soundtrack as an **MP3** and bring it into **CapCut** for the final edit.

To see the final result, watch the full tutorial linked at the beginning of this guide.

Bonus — Understanding the Credit System

Let's take a look at how the credit system works.

In the bottom-left corner, click on your account to see your available credits. You can also click on your credit balance to view your credit history.

According to the current setup shown in the tutorial, a new account receives **500 free credits**, plus **30 additional credits every day** that accumulate over time.

Get Additional Credits

You can earn bonus credits by inviting your friends to Google Flow Music.

1. Click **Invite** and copy your referral link.
2. Share your link with your friends.
3. For every account that signs up through your referral link, **you'll receive 500 bonus credits**.

The exact credit and referral amounts may change over time, so check your Flow Music account for the current terms and available bonuses.

Conclusion

Google Flow Music lets you turn an existing script into a complete AI filmmaking workflow.

Starting from your script, you can build cinematic scenes, add dialogue and voices, create a matching soundtrack, and bring everything together into a finished short film.

The workflow in this guide is designed to be reused. Adapt the prompts to your own script and build your film one scene at a time.

For the complete workflow in action, watch the full tutorial linked at the beginning of this guide.

Now it's your turn to create.

Thank you for supporting PYROS AI Creative.
