GOOGLE FLOW STORYBOARD STUDIO

AI FILMMAKING GUIDE

FROM IDEA TO SHORT FILM

- 1 IDEA
- 2 SCRIPT
- 3 STORYBOARD
- 4 CHARACTERS
- 5 LOCATIONS
- 6 PRODUCTION
- 7 FINAL FILM

pyrosaicreative.com

LEARN · CREATE · TELL · BEYOND

Welcome to the PYROS AI Filmmaking Guide

Every film begins with an idea.

But turning that idea into something you can actually see on screen requires much more than a story. Characters need to be defined. Scenes need to be structured. Locations and visual elements need to exist. Shots need to be planned. And eventually, everything has to come together as moving images.

Google Flow Storyboard Studio brings many of these steps into a single creative environment.

In this guide, we'll use Storyboard Studio as the backbone of a complete AI filmmaking workflow — starting with a simple story concept and progressively turning it into scenes, characters, locations, storyboards, shots, and finally video.

The process is designed to work at different levels of creative control. You can start with nothing more than a basic idea and let AI develop the missing elements, or provide more detailed direction when you want to shape the story yourself.

The goal isn't simply to generate a video.

It's to experience how an idea can move through a filmmaking process — from the first creative decision to the final shot.

Idea → Story → Scenes → Storyboard → Shots → Film

Purpose

Learn a practical AI filmmaking workflow using **Google Flow's Storyboard Studio** to develop a short film from an initial idea to finished video.

You'll learn how to move through the key stages of production — developing the story, structuring the narrative, building scenes and assets, creating a storyboard, generating shots, and turning those shots into a finished film.

The workflow is designed to let you decide how much creative control you want to maintain while using AI to accelerate the filmmaking process.

Deliverables

By the end of this guide, you'll have:

- **AI Story Prompt** — a reusable prompt for developing an original short-film concept into a complete three-act story.
- **Three-Act Story** — a complete narrative with a clear setup, escalation, climax, and resolution.
- **Character Reference Sheets** — visual references for the main characters, designed to establish their appearance and identity throughout the film.
- **Location References** — visual references for the key locations and environments used throughout the story.
- **Prop References** — visual references for important objects and story elements that appear across different scenes.
- **Storyboard** — a visual breakdown of the film organized into scenes and individual shots.
- **Animated Scenes** — all storyboard scenes transformed into AI-generated video sequences.
- **AI Short Film** — the complete film assembled from the generated scenes.

This Workflow Is Designed For:

-  AI short films and narrative productions
-  Cinematic scenes and storytelling experiments
-  Commercials and branded storytelling
-  Concept films and visual development
-  Story-driven AI filmmaking projects

How Much Creative Control Do You Want?

The workflow can adapt to different creative approaches.

You can start with a simple idea and let AI develop the story, characters, conflict, setting, and other creative elements.

Or you can provide detailed creative direction and use AI primarily to develop and organize your vision.

You can also combine both approaches — defining the elements that matter most to you while allowing AI to develop the rest.

More input gives you more control.

Less input gives AI more creative freedom.

The workflow is designed to support both.

The PYROS AI Filmmaking Workflow with Google Flow Storyboard Studio

From Idea to AI Short Film

This workflow takes you from a simple story idea to a complete AI short film using Google Flow and Storyboard Studio.

The workflow follows a simple production pipeline:

STORY DEVELOPMENT → ASSETS (CHARACTERS → LOCATIONS → PROPS) → STORYBOARD → ANIMATION → SHORT FILM

1. Open Google Flow

Open **Google Flow** and create a new project.

From the left sidebar, click **Tools**.

In the top navigation bar, click **Templates**.

Scroll down until you find **Storyboard Studio** and open it.

2. Choose Your Storyboard Style

Storyboard Studio offers different visual styles for developing your storyboard.

Choose the style that best matches the type of project you are creating.

Realistic

Photorealistic imagery with a cinematic, live-action appearance. A strong choice for realistic filmmaking and projects that aim for a natural, cinematic visual language.

3D Animation

A three-dimensional animated look with rendered characters and environments. Suitable for projects built around a stylized 3D visual language.

Charcoal

A monochromatic, hand-drawn look with visible charcoal-like strokes and a more expressive visual treatment. Useful for exploring composition, mood, and dramatic imagery.

Claymation

A handcrafted clay-animation aesthetic with the appearance of stop-motion characters and environments. Suitable for projects that intentionally use a tactile, miniature, animated look.

Concept Sketch

A loose, sketch-based visual style focused on quickly communicating the composition and visual idea of a shot. Useful when exploring scenes, framing, and visual direction before committing to a more finished look.

3. Create Your Story

Go to the **Google Flow Storyboard Studio – The AI Filmmaking Guide** guide and scroll down to the **PYROS Short Film Story Prompt**.

Copy the prompt and paste it into a text editor.

Fill in the sections highlighted in **yellow** with your own ideas and information, **OR** delete the yellow instructions and leave the sections highlighted in **green** unchanged to let the AI make the creative decisions for you.

Once you have completed the prompt, copy the modified version.

Go back to **Google Flow → Storyboard Studio** and paste it into the prompt bar.

Storyboard Studio will use your prompt to develop the story and organize it into a **three-act structure**, creating the foundation for the rest of the filmmaking workflow.

PYROS Short Film Story Prompt

Create an original short film story in 3 acts.

STORY IDEA:
[Describe your story idea, premise, situation, theme, or any creative concept you already have OR create an original story idea based on the other information provided.]

GENRE:
[Choose a genre such as: Action, Sci-Fi, Thriller, Horror, Mystery, Romance, Drama, Fantasy, Adventure, Comedy, Crime, Historical, OR a combination of genres OR choose the most appropriate genre based on the other information provided and the story concept.]

SUBGENRE:
[Automatically select a suitable subgenre that strengthens the main genre and story premise.]

PROTAGONIST:
[Describe the main character OR create a compelling protagonist appropriate for the story.]

ANTAGONIST:
[Describe the person, organization, force, creature, or circumstance opposing the protagonist OR create an appropriate antagonist or opposing force that directly challenges the protagonist and creates meaningful dramatic conflict.]

SETTING:
[Describe where and when the story takes place OR create a distinctive setting that supports the genre, characters, and story conflict.]

CORE CONFLICT:
[Describe the central problem, threat, or dilemma driving the story OR create an original central conflict that gives the protagonist a clear challenge and creates escalating dramatic stakes.]

GOAL:
[Describe what the protagonist ultimately wants or must accomplish OR create a clear and meaningful goal for the protagonist that naturally emerges from the central conflict.]

VISUAL TONE:
[Describe the desired cinematic aesthetic OR choose a visual tone appropriate for the genre, setting, and story, prioritizing realistic, cinematic, and visually compelling imagery suitable for AI filmmaking.]

STORY DEVELOPMENT

Build the story around the protagonist's goal, actions, decisions, obstacles and consequences. Give the protagonist a clear motivation, escalating obstacles, rising stakes and a meaningful choice at the climax. The antagonist or opposing force must actively challenge the protagonist and adapt to their actions. Let the central conflict drive the story.

Every major scene must advance the story, reveal information, develop the protagonist, increase the conflict, change

the situation, or contribute to the climax. Continuously escalate the stakes and force new decisions.

Avoid unnecessary subplots, characters and locations. Prioritize visual storytelling through actions, environments, objects and character behavior rather than exposition or lengthy dialogue. Every scene must be visually clear and suitable for cinematic AI-generated imagery and video.

CREATIVE ORIGINALITY

Create a distinctive, original story rather than a generic genre example. Avoid predictable clichés, archetypes, settings and visual tropes. Do not assume the genre requires a specific character, setting, antagonist or visual style. Make creative choices based on the story inputs and give the film its own identity.

THREE-ACT STRUCTURE

ACT I — SETUP

Introduce the protagonist, world and central conflict. Establish the protagonist's goal and motivation. Create a strong inciting incident that forces the protagonist to act. End the act with a decisive event, discovery or choice that changes the situation.

ACT II — ESCALATION

The protagonist actively pursues the goal while facing increasingly difficult obstacles. The opposing force adapts and escalates. Introduce complications, discoveries and reversals, including a meaningful midpoint change. Build toward a major setback, loss, revelation or apparent defeat that pushes the protagonist to their lowest point.

ACT III — CLIMAX & RESOLUTION

Build toward the decisive confrontation with the central conflict and opposing force. Force the protagonist to make a meaningful choice or take decisive action. The climax may be a confrontation, revelation, sacrifice, escape, transformation, discovery or other decisive event. Resolve the central conflict, show the consequences, and end with a memorable final image that reinforces the story's meaning or transformation.

Keep the story suitable for a short film and prioritize cinematic scenes that can be realistically translated into AI-generated images and video. The final story must have a clear beginning, escalation, climax and resolution.

4. Review Your Story

Once your story is generated, read through the script that Storyboard Studio created.

Review the narrative, dialogue, character actions, and pacing.

Edit or rewrite any parts you don't like to make sure the story fits your creative vision before moving forward.

I recommend copying the final script and saving it in a text file. This gives you a backup of your finished story, and you will need the script later when generating the video scenes.

5. Asset Generation

Navigate to the top menu and click on **Assets**.

Storyboard Studio automatically identifies the visual elements from your story and organizes them into three categories:

Characters → Locations → Props

These assets will later be used to build your storyboard and generate the individual scenes of your short film.

Auto-Generate Characters

Click **Autofill characters**.

Storyboard Studio analyzes your three-act story and automatically creates visual references for the characters identified in the script.

Regenerate or Fine-Tune an Asset

If you don't like a specific character, hover over its visual card and click the **Regenerate icon** (circular arrow) to create a new variation.

OR

Click directly on any asset image.

A panel will open on the right side of the screen where you can customize the asset details.

- **Name:** Update or refine the character or item name.
- **Visual Description:** Modify physical traits, facial features, skin tone, hair, or expression.
- **Clothing & Accessories:** Change outfits, armor, costumes, or accessories to match your creative vision.

6. Generate Locations & Props

Once you are satisfied with your characters, repeat the same process for **Locations** and **Props**.

Use **Autofill** to generate the assets, then regenerate or fine-tune any asset until you are satisfied with the result.

7. Generate Your Storyboard

Once all your **Characters, Locations, and Props** are ready, click **Storyboard** in the top menu.

Storyboard Studio will organize your story into **Scenes**. If Act Sections appear, do not generate the Act sections; generate only the individual **Scenes**.

Click **Autofill Scenes** to generate the storyboard frames for each scene.

Review the generated images and make adjustments where needed:

- If an action requires more frames to be clearly represented, add additional frames.
- If a scene does not match your creative vision, regenerate it.
- If you notice character inconsistencies, open the scene and add the missing **Reference Assets** to the prompt, such as the appropriate character reference sheets, then regenerate the scene.
- You can also edit an existing **Frame Description** or add new frame descriptions when important visual information or actions are missing.

Continue refining the storyboard until the scenes accurately represent the story and are visually consistent.

8. Save Your Project

Once you are satisfied with your storyboard, click the **three-dot menu** in the top bar, next to the storyboard style, and save your project.

9. Add Voices to Your Characters

Now it's time to assign a voice to each character.

In the left panel, click **Characters** and select **Add from a project**. Choose one of your characters, then click **Select a voice**.

Choose the voice you like best. If needed, you can further customize it by describing the desired voice in **Customize Performance**. Add a line of dialogue from your script to hear how that voice actually sounds delivering the character's dialogue.

Once you are satisfied with the result, click **Add to Character**, then click **Done**.

Repeat the same process for each character in your story.

10. Animate Your Scenes

Once your storyboard is complete, click **All Media**.

You can now choose between two different ways to animate your scenes:

Agent Mode — Let Agent handle the video-generation process for you, using your script and project assets.

Standard Mode — Create and control the video-generation prompt yourself for greater control over the final result.

Choose the method that best fits your workflow and the level of creative control you want.

A – Agent Mode

Select the frame you want to animate and attach it to the **Prompt** box. Then select **Agent**.

Go to the text file where you saved your final script. Copy the section of the scene you want to animate and paste it into the prompt.

Tag the relevant **Characters, Locations, and Props** from your project so Agent can use the correct visual references when generating the video.

Click **Generate**. Agent will show you how many credits the generation will use before creating the video. Review the cost and approve the generation.

Your first video scene will then be generated.

Keep the Prompt Within the Video Duration

Keep in mind that each video generation can be up to 10 seconds long, so avoid pasting too much script into a single generation. If a scene contains more action than can fit into 10 seconds, break it into smaller sections or attach multiple frames and instruct Agent to create separate video clips.

B – Use Standard Mode for More Control

If you want more control over how each video is generated, you can use **Standard Mode** instead of Agent.

For this method, you can use the **Cinematic Scene Prompt Builder** to turn each scene from your script into a detailed, production-ready video prompt.

Copy the **Cinematic Scene Prompt Builder** from the guide and paste it into **Claude**. Then add your scene description to the highlighted section:

[DESCRIBE WHAT HAPPENS IN THE VIDEO]

Provide the visual references relevant to the scene:

- **Frame(s)** — to guide the composition and intended action.
- **Character Reference Sheet(s)** — one for each character appearing in the scene.
- **Location Reference** — for the environment where the scene takes place.
- **Prop Reference(s)** — for important objects used in the scene.

Generate the Video Prompt

Run the **Cinematic Scene Prompt Builder** and copy the final prompt it generates.

Then return to **Google Flow** and select **Standard Mode**.

Set the video model to **Omni Flash**, choose your desired **resolution (720p or 360p)**, and set the **video duration** for the scene.

You can also choose between **Frames** and **Ingredients**:

- **Frames** — use storyboard or generated frames as visual references. You can optionally select a **Start Frame** and **End Frame** to define the beginning and ending visual states of the video.
- **Ingredients** — use your **Storyboard frame, Characters, Locations, and Props** as references to maintain visual consistency throughout the generation.

Now, paste the generated prompt, and tag all relevant **Characters, Locations, and Props** using your project assets.

Review the prompt and references before generating the video.

When everything is ready, generate your video.

This method gives you more direct control over the action, camera, pacing, visual details, and references used for each shot.

Continue this process for each scene until you have generated all the video clips needed for your short film.

Cinematic Scene Prompt Builder

I want you to turn my scene description and the attached visual references into a complete video-generation prompt.

SCENE:

[DESCRIBE WHAT HAPPENS IN THE VIDEO]

ATTACHED REFERENCES:

Use all attached assets as visual references according to their type and upload order.

Analyze the scene and references and determine everything required to generate the video, including character actions, interactions, expressions, camera, composition, movement, timing, environment, lighting and sound.

If dialogue is present in the scene, include the dialogue exactly as provided and create the corresponding character

performance and lip synchronization.

If a Start frame is attached, explicitly identify the corresponding asset using its @Image tag and designate it as the start frame.

If an end frame is attached, explicitly identify the corresponding asset using its @Image tag and designate it as the end frame.

Create the final video-generation prompt using this structure:

ASSET REFERENCES

Clearly map every attached asset by upload order and refer to each asset using the exact reference tag format used by the video generator, such as @Image1, @Image2, @Audio1, etc.

Example:

@Image1 — Character Reference: subject1

@Image2 — Character Reference: subject2

@Image3 — Environment Reference: environment1

@Image4 — Prop Reference: prop1

@Image5 — Start Frame

ONE-SENTENCE SUMMARY

Write one concise sentence describing the subject, environment, event, cinematic style and camera movement.

DETAILED PLOT

Describe the complete visual progression of the video, which can be **up to 10 seconds long**.

Use timestamps or shot numbers whenever the scene contains multiple actions or camera changes.

For every section, define the relevant action, character performance, camera movement, dialogue and sound.

REFERENCE CONSISTENCY

Clearly state how the character, environment and prop references must be preserved throughout the video.

CAMERA

Define the appropriate shot sizes, angles, lens perspective and camera movements for the scene.

LIGHTING & STYLE

Define the appropriate cinematic lighting, atmosphere and visual style.

AUDIO

Include dialogue, voice performance and synchronized sound effects whenever they are relevant to the scene or provided through an audio reference.

If the scene contains no dialogue, do not invent dialogue.

If no music is requested, do not add background music.

NEGATIVE REQUIREMENTS

Include only necessary restrictions that prevent unwanted results in this specific scene.

OUTPUT

Return ONLY the final video-generation prompt.

Always reference uploaded assets using their exact @Image1, @Image2, @Image3, @Audio1, etc. tags throughout the generated prompt. Never write “Image 1”, “Image 2””, or similar generic references.

Do not explain your choices.

Do not add commentary before or after the prompt.

Do not provide multiple versions.

Conclusion

You've completed the **PYROS AI Filmmaking Workflow with Google Flow Storyboard Studio**.

You started with a simple idea and learned how to develop it into a structured three-act story, build your characters, locations and props, create a complete storyboard, add character voices, and turn individual scenes into cinematic AI video.

You can now use this workflow to create:

- **Original short film stories structured in three acts**
- **Consistent Characters, Locations, and Props**
- **Detailed storyboards organized into Acts and Scenes**
- **Character voices and performances**
- **Cinematic video scenes using Agent Mode or Standard Mode**
- **Production-ready video prompts with precise creative control**
- **Complete AI-generated short films**

The key is simple:

Story → Assets → Storyboard → Animation → Short Film

AI video generation will naturally vary depending on the model, references, prompts, and generation settings. No workflow can guarantee a perfect result in every shot. The goal is to give the AI a strong creative and visual foundation while giving you enough control to refine, regenerate, and improve each scene.

The more carefully you develop the story, assets, storyboard, and prompts, the more control you have over the final film.

Thank you for supporting PYROS AI Creative.
